Runtime lifecycle

Supervisor startup and one worker turn, in code order

a2ad start (Supervisor::run, crates/a2ad/src/supervisor.rs)

D-01

layout, operator
ensure_layout, ensure_operator
trust file under the roots

→

identities
check_path_budget, reclaim_stale
ensure_identity per agent

→

health port
HealthServer::bind
before the broker starts

→

broker
Broker::start, render_config
NATS server for the bus

→

supervise
children run as: a2ad host <id>
restarts with backoff

worker turn (Worker::serve_one, pump)

bus request
requests.next() (bus binding)
one request per serve_one

→

serve_request
request decoded and
routed to the worker

→

handle
Worker::handle(inbound, now)
rpc.rs

→

Backend::start
StartTurn; the backend emits
BackendEvent through the sink

→

pump
backend events, health, cancels,
deadlines, approval expiry, outbox

Source order

- Startup order is the code order of Supervisor::run (supervisor.rs).
- Each child host is the same binary: current_exe host <id> --config <path>.

Worker

- Outbound peer calls keep serving bus requests while they wait (RFC-0015).
- pump runs on each wakeup: events, health, cancels, deadlines, expiry, outbox.
