R-01

ID	priority	where	finding	proposal
E-01	high	driver-acp (approval expiry)	Live S4c fails: the task ends BACKEND_CRASHED with null detail, not APPROVAL_TIMEOUT (docs/spikes/e2e-m1.md, verdict table). Cause not confirmed. The older case table in the same file still shows S1 FAIL and S4a to S8 NOT RUN, which contradicts the verdicts.	Read the logs of that run to confirm the cause; fix the ordering of worker expiry and driver backstop; rerun S4c live and record the verdict.
G-01	high	gateway-http (tls.rs)	The TLS key must be owner-only on Unix, but Windows ACLs are not inspected (crates/gateway-http/src/tls.rs lines 1-4; RFC-0008 [0008-066], [0008-068]).	Check the key ACL on Windows (icacls, as crates/a2ad/src/platform.rs does) and add a test for a key readable by other users.
D-01	medium	a2ad (supervisor) and a2a-worker (crash path)	Restart scenarios 0014-028 (supervisor killed) and 0014-029 (worker crash) are NOT RUN live (docs/spikes/e2e-m1.md, rows 0014-028 and 0014-029).	Run both live on Windows with the spike harness and record the verdicts in e2e-m1.md.
P-01	medium	a2ad config and a2a-worker delegation	delegation.auto_allow_peer_tools (RFC-0015 [0015-087], RFC-0006 [0006-061]) does not appear anywhere in crates/ (grep). Peer-tool calls always wait for an operator.	Decide for M1: implement the key or move it out of M1 in the RFCs; record the decision.
A-01	low	a2a-audit (gaplog.rs)	audit-gaps.log has no rotation (crates/a2a-audit/AGENTS.md line 37; RFC-0013 [0013-039]).	Add size or day rotation with the same retention rule as the JSONL sink.
R-01	low	RFC-0006 line 36 (a2a-core budget.rs)	RFC-0006 line 36 says the unlimited sentinel is valid at the root for wall time. [0006-032], the RFC-0006 table row 0006-032, and Allowance::validate (budget.rs line 129) refuse it for wall time.	Correct line 36 to tokens and cost only. The code and [0006-032] agree.

6 points: 2 high, 2 medium, 2 low.

Suggested order

- E-01 first: S4c is the only FAIL in the verdict table of docs/spikes/e2e-m1.md.
- G-01 next: RFC-0008 [0008-066] requires the owner-only key check on every platform.

E-01 → G-01 → D-01 → P-01 → A-01 → R-01
