Approval path

Tier assignment, request states and the timing constants

Timing (code values)

- Approval expiry: DEFAULT_EXPIRY_MS = 300 s (crates/a2a-core/src/approval.rs).
- Driver permission backstop: DEFAULT_PERMISSION_TIMEOUT = 330 s; must exceed the expiry (check_permission_timeout, driver-acp config.rs).
- Driver turn idle: DEFAULT_TURN_IDLE_TIMEOUT = 600 s (driver-acp config.rs).

Rule

- Worker approval expiry is authoritative (commit 9a4172a). Live S4c confirms APPROVAL_TIMEOUT; after expiry the backend is killed non-terminally and the next task starts a fresh one.
