A-01

a2a-core — 1 low

R-01

ID	priority	where	finding	proposal
G-01	high	gateway-http (tls.rs)	The TLS key must be owner-only on Unix, but Windows ACLs are not inspected (crates/gateway-http/src/tls.rs lines 1-4; RFC-0008 [0008-066], [0008-068]).	Check the key ACL on Windows (icacls, as crates/a2ad/src/platform.rs does) and add a test for a key readable by other users.
D-01	medium	a2ad (supervisor) and a2a-worker (crash path)	Restart scenarios 0014-028 (supervisor killed) and 0014-029 (worker crash) are NOT RUN live (docs/spikes/e2e-m1.md, rows 0014-028 and 0014-029).	Run both live on Windows with the spike harness and record the verdicts in e2e-m1.md.
P-01	medium	a2ad config and a2a-worker delegation	delegation.auto_allow_peer_tools (RFC-0015 [0015-087], RFC-0006 [0006-061]) does not appear anywhere in crates/ (grep). Peer-tool calls always wait for an operator.	Decide for M1: implement the key or move it out of M1 in the RFCs; record the decision.
A-01	low	a2a-audit (gaplog.rs)	audit-gaps.log has no rotation (crates/a2a-audit/AGENTS.md line 37; RFC-0013 [0013-039]).	Add size or day rotation with the same retention rule as the JSONL sink.
R-01	low	RFC-0006 line 36 (a2a-core budget.rs)	RFC-0006 line 36 says the unlimited sentinel is valid at the root for wall time. [0006-032], the RFC-0006 table row 0006-032, and Allowance::validate (budget.rs line 129) refuse it for wall time.	Correct line 36 to tokens and cost only. The code and [0006-032] agree.

5 points: 1 high, 2 medium, 2 low.

Suggested order

- G-01 first: RFC-0008 [0008-066] requires the owner-only key check on every platform.

G-01 → D-01 → P-01 → A-01 → R-01
